SURAKSHAGAN

Day 3 assessment

1. How to use the cbind() and rbind() in data frame for the fields city and

zipcodedatas using vector and data frame.

Create a vectors:

cbind() function:

Output:

city zipcode

[1] delhi 123456

[2] bangalore 789654

[3] chennai 698748

[4] mumbai 456986

rbind() function:

Output:

city zipcode

[1] delhi 123456

[2] bangalore 789654

[3] chennai 698748

[4] mumbai 456986

[5] punjab 456978

[6] kerala 569875

CODE:

```
> # create a vector for city
> city_vec = c('delhi', 'bangalore', 'chennai', 'mumbai')
> # create a vector for zip code
> zip_vec = c(123456, 789654, 698748, 456986)
> # use cbind() to create a data frame
> cbind_df = data.frame(city = city_vec, zipcode = zip_vec)
> # view the output
> print(cbind_df)
       city zipcode
1     delhi  123456
2 bangalore  789654
3   chennai  698748
4    mumbai  456986
> # create a new data frame to add rows
> rbind_df = data.frame(city = c('punjab', 'kerala'),
+                       zipcode = c(456978, 569875))
> # use rbind() to add rows to the existing data frame
> final_df = rbind(cbind_df, rbind_df)
> # view the output
> print(final_df)
       city zipcode
1     delhi  123456
```

192121034
SURAKSHAGAN

```
2 bangalore  789654
3   chennai  698748
4    mumbai  456986
5    punjab  456978
6    kerala  569875
```

2. Create First Dataset with variables

● surname

● nationality

Create Second Dataset with variables

● surname

● movies

The common key variable is surname. How to merge both data and check if the

dimensionality is 7x3.

Output:

surname nationality title

1 Hitchcock UK Psycho

2 Hitchcock UK North by Northwest

3 Polanski Poland Chinatown

4 Scorsese US Taxi Driver

5 Spielberg US Super 8

6 Spielberg US Catch Me If You Can

7 Tarantino US Reservoir Dogs

CODE:

```
import pandas as pd

# create the first dataset
df1 = pd.DataFrame({
    'surname': ['Hitchcock', 'Polanski', 'Scorsese'],
    'nationality': ['UK', 'Poland', 'US']
})
# create the second dataset
df2 = pd.DataFrame({
```

192121034
SURAKSHAGAN

```
    'surname': ['Hitchcock', 'Spielberg', 'Tarantino'],
    'movies': ['Psycho, North by Northwest', 'Super 8, Catch Me If You Can', 'Reservoir Dogs']
})
# merge the two datasets
merged_df = pd.merge(df1, df2, on='surname')

# split the 'movies' column into separate rows
merged_df = merged_df.assign(movies=merged_df['movies'].str.split(', ')).explode('movies')

# add a 'title' column based on the 'movies' column
merged_df = merged_df.assign(title=merged_df['movies'])

# remove the 'movies' column
merged_df = merged_df.drop('movies', axis=1)

# reorder the columns
merged_df = merged_df[['surname', 'nationality', 'title']]
# check the dimensionality of the merged dataset
assert merged_df.shape == (7, 3)
# view the final output
print(merged_df)
```

3. Write a R program to create an empty data frame.

Output:

```
[1] &amp;quot;Structure of the empty dataframe:&amp;quot;
&amp;#39;data.frame&amp;#39;: 0 obs. of 5 variables:
$ Ints : int
$ Doubles : num
$ Characters: chr
$ Logicals :logi
$ Factors : Factor w/ 0 levels:
NULL
```

192121034
SURAKSHAGAN

CODE:

```
> # create an empty data frame
> empty_df <- data.frame(Ints = integer(),
+                        Doubles = numeric(),
+                        Characters = character(),
+                        Logicals = logical(),
+                        Factors = factor(levels = character()))
> # print the structure of the empty data frame
> cat("Structure of the empty dataframe:\n")
Structure of the empty dataframe:
> str(empty_df)
'data.frame':  0 obs. of  5 variables:
 $ Ints      : int
 $ Doubles   : num
 $ Characters: chr
 $ Logicals  : logi
 $ Factors   : Factor w/ 0 levels:
```

4. Write a R program to create a data frame from four given vectors

name = c('Anastasia', 'Dima', 'Katherine', 'James', 'Emily', 'Michael', 'Matthew',

'Laura', 'Kevin', 'Jonas')

score = c(12.5, 9, 16.5, 12, 9, 20, 14.5, 13.5, 8, 19)

attempts = c(1, 3, 2, 3, 2, 3, 1, 1, 2, 1)

qualify = c('yes', 'no', 'yes', 'no', 'no', 'yes', 'yes', 'no', 'no', 'yes')

Output:

[1] "Original data frame:"

[1] "Anastasia" "Dima" "Katherine" "James" "Emily" "Michael"

[7] "Matthew" "Laura" "Kevin" "Jonas"

[1] 12.5 9.0 16.5 12.0 9.0 20.0 14.5 13.5 8.0 19.0

[1] 1 3 2 3 2 3 1 1 2 1

[1] "yes" "no" "yes" "no" "no" "yes" "yes" "no" "no" "yes"

name score attempts qualify

1 Anastasia 12.5 1 yes

2 Dima 9.0 3 no

3 Katherine 16.5 2 yes

4 James 12.0 3 no

5 Emily 9.0 2 no

6 Michael 20.0 3 yes

192121034
SURAKSHAGAN

7 Matthew 14.5 1 yes

23. Write a R program to count the number of NA values in a data frame column.

Output:

[1] "Original dataframe:"

name score attempts qualify

1 Anastasia 12.5 1 yes

2 Dima 9.0 NA no

3 Katherine 16.5 2 yes

4 James 12.0 NA no

5 Emily 9.0 2 no

6 Michael 20.0 NA yes

7 Matthew 14.5 1 yes

8 Laura 13.5 NA no

9 Kevin 8.0 2 no

10 Jonas 19.0 1 yes

[1] "The number of NA values in attempts column:"

[1] 4

CODE:

```
> # create the data frame
> df <- data.frame(
+   name = c("Anastasia", "Dima", "Katherine", "James", "Emily", "Michael"
, "Matthew", "Laura", "Kevin", "Jonas"),
+   score = c(12.5, 9.0, 16.5, 12.0, 9.0, 20.0, 14.5, 13.5, 8.0, 19.0),
+   attempts = c(1, NA, 2, NA, 2, NA, 1, NA, 2, 1),
```

27. Find the difference between Data Frames and other Data Structures with example.

Solution:

Data Structure:

There is also an array data structure that extends this idea to more than two dimensions. A collection of vectors that all have the same length. This is like a matrix, except that each column can contain a different data type.

Eg:Array, Linked Lists, Stack, Queues, Trees, Graphs, Sets, Hash Tables.

Data Frame:

192121034
SURAKSHAGAN

A data frame can be used to represent an entire data set. A data frame is a table or a

two-dimensional array-like structure in which each column contains values of one

variable and each row contains one set of values from each column.

Eg: Matrices

ANS:

Tables, Spreadsheets, Database tables.

Example:

Let's consider an example to understand the difference between Data Frames and other Data Structures. Suppose we have a dataset containing information about students in a class, including their names, ages, grades, and subjects. We want to analyze this data and find out which students are performing well in which subjects. Here are some ways we can represent this data:

Array: We can use a three-dimensional array to represent this data, where the first dimension represents the student, the second dimension represents the subject, and the third dimension represents the variable (name, age, grade). However, this can be difficult to work with, and we would need to use complex indexing to access specific values.

Linked List: We can use a linked list to represent each student, where each node in the list contains the student's information. However, this would not allow us to easily compare or analyze data across multiple students.

Data Frame: We can use a data frame to represent this data, where each column represents a variable (name, age, grade, subject), and each row represents a student. This would allow us to easily compare and analyze data across multiple students and subjects.

In summary, while other data structures like arrays and linked lists can be used to represent data, they may not be as efficient or convenient for analyzing complex data sets like those found in a data frame.

28. How to create the data frame and print it for the employee data set.

Emp_id = 1:5

Emp_name = "Ricky","Danish","Mini","Ryan","Gary"

Salary = 643.3,515.2,671.0,729.0,943.25

Start_date = "2022-01-01", "2021-09-23", "2020-11-15", "2021-05-11","2022-03-

192121034
SURAKSHAGAN

27"

CODE:

```
> # create the data frame
> employee_df <- data.frame(
+   Emp_id = 1:5,
+   Emp_name = c("Ricky","Danish","Mini","Ryan","Gary"),
+   Salary = c(643.3,515.2,671.0,729.0,943.25),
+   Start_date = c("2022-01-01", "2021-09-23", "2020-11-15", "2021-05-11",
"2022-03-27")
+ )
> # print the data frame
> employee_df
  Emp_id Emp_name Salary Start_date
1      1    Ricky 643.30 2022-01-01
2      2   Danish 515.20 2021-09-23
3      3     Mini 671.00 2020-11-15
4      4     Ryan 729.00 2021-05-11
5      5     Gary 943.25 2022-03-27
```

29. Write the code to get the Structure of the R Data Frame.

CODE:

```
> # create a sample data frame
> df <- data.frame(
+   x = c(1, 2, 3),
+   y = c("A", "B", "C"),
+   z = c(TRUE, FALSE, TRUE)
+ )
> # get the structure of the data frame
> str(df)
'data.frame':  3 obs. of  3 variables:
 $ x: num  1 2 3
 $ y: chr  "A" "B" "C"
 $ z: logi  TRUE FALSE TRUE
```

30. How to extract data from data frame for the above employee dataset.

Expected Output:

emp.data.emp_name. emp.data.salary

1 Ricky 643.30

2 Danish 515.20

3 Mini 671.00

4 Ryan 729.00

5 Gary 943.25

CODE:

```
> # create the data frame
> employee_df <- data.frame(
+   Emp_id = 1:5,
+   Emp_name = c("Ricky","Danish","Mini","Ryan","Gary"),
```

192121034
SURAKSHAGAN

```
+   Salary = c(643.3,515.2,671.0,729.0,943.25),
+   Start_date = c("2022-01-01", "2021-09-23", "2020-11-15", "2021-05-11",
"2022-03-27")
+ )
> # extract employee names and salaries
> emp_names <- employee_df$Emp_name
> emp_salaries <- employee_df$Salary
> # create a data frame with the extracted data
> emp_data <- data.frame(emp_name = emp_names, salary = emp_salaries)
> # print the data frame
> emp_data
  emp_name salary
1    Ricky 643.30
2   Danish 515.20
3     Mini 671.00
4     Ryan 729.00
5     Gary 943.25
```

31. How to extract the first two rows and then all columns in employee data frame.

Expected Output:

emp_idemp_name salary start_date

1 Ricky 643.3 2012-01-01

2 Danish 515.2 2013-09-23

CODE:

```
> employee_df[1:2, ]
  Emp_id Emp_name Salary Start_date
1      1    Ricky  643.3 2022-01-01
2      2   Danish  515.2 2021-09-23
```

32. Write a code to extract 3 rd and 5 th row with 2 nd and 4 th column of the employee

data.

Expected Output:

emp_namestart_date

3 Mini 2014-11-15

5 Gary 2015-03-27

CODE:

```
> employee_df[c(3,5), c(2,4)]
  Emp_name Start_date
3     Mini 2020-11-15
5     Gary 2022-03-27
```

Data Reshaping:

Data reshaping means changing how data is represented in rows and column. It includes

splitting, merging or interchanging the rows and columns.

Reshaping functions:

● cbind()

● rbind()

● mergr()

33. How to expand the data frame by adding rows and columns in data frame for

employee data set.

Add Column: dept<-
c("IT","Operations","IT","HR","Finance")

Expected Output:

emp_idemp_name salary start_date dept

1 Ricky 643.30 2012-01-01 IT

2 Danish 515.20 2013-09-23 Operations

3 Mini 671.00 2014-11-15

4 Ryan 729.00 2014-05-11 HR

5 Gary 943.25 2015-03-27 Finance

Add Row using the second dataframe given below:

emp_id = 6:8,

emp_name = "Rasmi","Pranab","Tusar",

salary =578.0,722.5,632.8,

CODE:

34. Write a R program to compare two data frames to find the row(s) in first data frame that

are not present in second data frame.

CODE:

```
# create the first data frame
> df1 <- data.frame(
+   ID = c(1, 2, 3, 4, 5),
+   Name = c("John", "Sara", "David", "Sarah", "Mike")
+ )
> # create the second data frame
> df2 <- data.frame(
+   ID = c(2, 4),
+   Name = c("Sara", "Sarah")
+ )
> # compare the two data frames and find rows in df1 that are not in df2
> df1_not_in_df2 <- anti_join(df1, df2, by = c("ID", "Name"))
Error in anti_join(df1, df2, by = c("ID", "Name")) :
  could not find function "anti_join"
> # print the result
> df1_not_in_df2
Error: object 'df1_not_in_df2' not found
```

35. Write a R program to find elements come only once that are common to both given data

frames.

CODE:

```
> # create two example data frames
> df1 <- data.frame(A = c(1, 2, 3, 4, 5),
+                   B = c("apple", "banana", "cherry", "banana", "apple"))
> df2 <- data.frame(A = c(2, 4, 6),
+                   B = c("banana", "apple", "orange"))
> # find elements that occur only once and are common to both data frames
> common <- intersect(df1$B, df2$B)
> result <- unique(df1$B[duplicated(df1$B) & df1$B %in% common])
> # print the result
> print(result)
[1] "banana" "apple"
```

36. Write a R program to create a data frame using two given vectors and display the

192121034
SURAKSHAGAN

duplicated elements and unique rows of the said data frame.

Practice Probs

File Read and Write Functions in R

Readline()

con <- file("Sample.txt", "r")

w<-readLines(con)

close(con)

w[1]

w[2]

w[3]

writeline()

sample<-c("Class,Alcohol,Malic acid,Ash","1,14.23,1.71,2.43","1,13.2,1.78,2.14")

writeLines(sample,"sample.csv")

dput() and dget():

Create a data frame

x <- data.frame(Name = "Mr. A", Gender = "Male", Age=35)

#Print 'dput' output to your R console

dput(x)

#Write the 'dput' output to a file

dput(x, file = "w.R")

Now read in 'dput' output from the file

y <- dget("w.R")

y

dump()

x<-1:10

d <- data.frame(Name = "Mr. A", Gender = "Male", Age=35)

192121034
SURAKSHAGAN

dump(c("x", "d"), file = "dump_data.R")

rm(x, d) #After dumping just remove the variables from environment.

source("dump_data.R")

x

d

str(d)

read & Write

> data <- read.csv("employee_data.csv", header = TRUE,sep=",")

> is.data.frame(data)

[1] TRUE

> ncol(data)

[1] 9

> nrow(data)

[1] 1000

> sal <- max(data$salary)

> sal

[1] 106905

>retval <-subset(data, gender=="M")

> write.csv(retval,"output.csv")

> dim(retval)

[1] 610 9

CODE:

```
# create two vectors
> vec1 <- c("A", "B", "C", "D", "E", "F")
> vec2 <- c(1, 2, 3, 4, 5, 6)
> # create a data frame from the vectors
> df <- data.frame(vec1, vec2)
> # display the duplicated elements
> duplicated_elements <- df[duplicated(df),]
> cat("Duplicated elements:\n")
Duplicated elements:
> print(duplicated_elements)
[1] vec1 vec2
<0 rows> (or 0-length row.names)
> # display the unique rows
> unique_rows <- unique(df)
> cat("\nUnique rows:\n")

Unique rows:
> print(unique_rows)
  vec1 vec2
1    A    1
```
